The original design of the upgrade triggering strategy was for the APP to automatically identify whether an upgrade was needed based on the current software version number of the device. However, due to incorrect responses to MCU software version and other info rmation, it was temporarily triggered by clicking on the device icon.

7.1: On the device list page, click on the device icon and a window will pop up for entering the firmware security code

7.2: Based on the security code entered by the user, pull the firmware information corresponding to the server and confirm th e upgrade
